

One Request. A Complete Change Proposal.

AgentTeams Travel Policy Change Demo

IN ONE SENTENCE

A user states the new policy once. The system searches across enterprise sources, identifies affected documents, generates forward and rollback patches, verifies them independently, and returns the package for human approval.

5

affected documents identified

10

reversible patch files

0

original files changed

Manager + three specialist agents: evidence research -> reversible changes -> independent verification -> human approval.

Three Agents Solve Three Parts of the Problem

Each Agent receives a bounded problem, produces declared artifacts, and hands measurable results to the next stage.

How the Manager Drove the End-to-End Task

run_id: agentteams-domestic-travel-15days-001

USER REQUEST Standardize domestic travel reimbursement to 15 calendar days after trip completion.

Find affected documents, create forward and rollback plans, verify independently, then submit for approval.

STAGE HANDOFF A1 evidence bundle -> A2 findings + patches -> A3 verification report

Every artifact is written to MinIO under the same run_id for the next stage.

Actual workers: EvidenceResearcher -> ConsistencyRemediator -> IndependentVerifier. All three used qwen3.7-plus.

A1 in Action: Cross-Source Retrieval to Evidence Package

The enterprise-rag Skill enforced semantic, multi-query, exact, and full-document retrieval.

14

queries

3

Gmail / Confluence / Drive

5

full policy documents

4

structured deliverables

What EvidenceResearcher actually did

- | | | |
|---|---------------------------|--|
| 1 | Parse request | 15 calendar days, effective date, domestic scope |
| 2 | semantic search | 5 semantic retrievals |
| 3 | multi-query search | 1 multi-query round with deduplication |
| 4 | exact search | 8 deadline and keyword checks |
| 5 | document fetch | 5 complete policy documents |
| 6 | Package evidence | citations, inventory, query log, evidence gaps |

Evidence findings and requested target

- | | |
|---|--|
| 1 | Current policy uses a 10-business-day rule |
| 2 | Some documents still reference 30 or 60 days |
| 3 | The topic is scattered across enterprise sources |
| 4 | Requested target: 15 calendar days from 2026-09-01 |

DELIVERABLES

evidence_bundle.json

file_inventory.json

query_log.json

evidence_summary.md

A1 result: three sources covered, critical policies read in full, and a traceable evidence package delivered to A2.

A2 in Action: Identify Impact and Generate Reversible Changes

A2 read the A1 evidence package, classified documents, and produced a file-by-file patch plan.

Five documents that must change

doc_id	Current deadline	Target deadline
b45102be...	10 business days	15 calendar days
b8348259...	60 days	15 calendar days
000aabb4...	10 business days	15 calendar days
4c3bf863...	30 days / 10 business days	15 calendar days
29d3cc9b...	conflicting wording	15 calendar days

- What A2 actually did
- 1

Read and validate the A1 evidence bundle
- 2

Classify all seven documents
- 3

Locate deadline and scope conflicts
- 4

Create five file-level change plans
- 5

Generate five forward patches
- 6

Generate five rollback patches
- modified_documents: empty

A2 deliverables: consistency_findings.json - change_plan.json - rollback_manifest.json - 10 patch files

A3 in Action: Verify Apply, Rollback, and Full Restoration

The verifier did not create the plan; it independently tested the A2 artifacts.

5 / 5

forward patches apply

5 / 5

rollback patches apply

5 / 5

SHA-256 restored

0

source documents modified

What IndependentVerifier actually did

- | | | |
|---|--|-------|
| 1 | Validate run_id, doc_id, and input scope | PASS |
| 2 | Verify SHA-256 of each original working copy | 5 / 5 |
| 3 | Run git apply --check on forward patches | 5 / 5 |
| 4 | Apply forward patches to working copies | 5 / 5 |
| 5 | Apply rollback patches to restore originals | 5 / 5 |
| 6 | Recalculate and compare SHA-256 | 5 / 5 |

Verification deliverables

verification_report.json

acceptance_decision.json

verification_summary.md

Mode proposal-only

Approval awaiting owner

No production modified_documents were created.

A3 result: the change set applies cleanly, rolls back completely, and is ready for human approval.

Automation Within Controlled, Reversible Boundaries

The system prepares the change; only structured approval can authorize controlled application.

Mechanical checks performed by IndependentVerifier

- 01** Match doc_id, file scope, and original SHA-256
- 02** Run git apply --check on every forward patch
- 03** Apply changes and verify the target rule
- 04** Apply rollback patches and recalculate SHA-256
- 05** Validate the declared file list and permission boundary

Structured approval

approval_id	Unique approval ID
approved_by	Approver identity
approved_files	Authorized files
expires_at	Approval expiry

A plain-language "yes" is not a formal approval.

Demo result: five forward patches apply, five rollback patches restore, and source documents remain unchanged.

What the Agents Solved - and What Comes Next

The demo replaced manual document-by-document checking with a traceable, reversible, human-controlled workflow.

14

retrieval queries

3

enterprise sources

5

full policy documents

5

forward patches

5

rollback patches

5/5

files fully restored

Solved in this demo

- 1 Found policy references across three disconnected sources
- 2 Identified five affected documents from seven reviewed
- 3 Generated five forward and five rollback patches
- 4 Verified apply, rollback, and SHA-256 restoration for 5/5 files
- 5 Kept all original enterprise documents unchanged

Next

- **Controlled source-system write-back**
Apply only approved files through enterprise connectors.
- **Approval integrations**
Connect enterprise identity, scope, and expiry controls.
- **Continuous drift monitoring**
Detect affected content whenever a policy changes.
- **Reusable domain Skills**
Extend the workflow to finance, HR, legal, and compliance.

Value: find impact systematically - generate consistent changes - verify independently - keep humans in control
